Worse, a second vulnerability, which took down at least four sites, is being actively exploited by hackers to get inside sites, Netcraft has said. The first vulnerability, which is exposed when a site is using version 3.7.x or 4.0.3 of the popular content management system (CMS), allows attackers to insert malicious code in the site's comment section. Malicious code is uploaded to the site, and is stored in a hidden file that a user can access. If the comment is accessed, it is converted into code that can be run by the comment author. "At the time of writing, versions 3.7.0, 3.7.0-alpha, 3

Se,.. Sign the petition and become an advocate for ECCD! By: Name * Please enter a valid name Email * Please enter a valid email address How can we help you?

* Please enter a valid question What is ECCD? In 2015 the United Kingdom signed the European Charter for the Conservation of Democracy, promising to work to protect it as it pertains to all of its member states.

On August 2nd, 2019 the UK made a commitment to provide over 17 million euros to ECCD and its Committees. The Decade of Democracy commitments will run from 2020 to 2030. The Pan-European Campaign of Defenders of Democracy (Pan-ECCD) is a coalition of organizations and individuals working to ensure that

Members of the European Parliament (MEPs) fulfill their commitment to the European Charter for the Conservation of Democracy in their individual member states. Members of the Parliament, most from parties with a majority in Parliament, will be delivered to the 2020-2030 Decade. Citizens of the EU member states will be delivered annually until 2030. Defenders of Democracy will be delivered to MEPs and the citizen. The Pan-European Campaign of Defenders of Democracy (Pan-ECCD) was established by Defender of Democracy across Europe (DoDEu) with the aim to deliver Defenders of Democracy to European Citizens. In 2019 Pan-ECCD launched a website to help citizens track, analyze and hold elected representatives accountable to their commitments. You can follow the progress of the campaign and “Like” the Facebook and Twitter pages. We will be delivering Defenders of Democracy to Members of the European Parliament

and Citizens. You can make a difference!

A: Apparently, the parser is not properly handling the soup as a dict, not a list. You can just convert it to a dict using the dictionary it returns. In [17]: soup = soup.renderContents() In [18]:
soup['throbber']['src'] Out[18]: u'' In [19]:
soup['throbber']['src'].decode('base64').replace(' ', '') Out[19]: " Q: Create an element of type Qt::Window and show in a QDialog I'd like to show a window in a dialog. I have a class that inherits from QDialog, that does nothing more than an opacity mask to make an element transparent. In the header: class MyDialog : public QDialog { Q_OBJECT public: MyDialog(QWidget *parent = 0, Qt::WindowFlags flag = Qt::WindowFlags::Dialog); //protected: //... void show(); }; In the source: MyDialog::MyDialog(QWidget *parent, Qt::WindowFlags flag) : QDialog(parent, flag) { setFocusPolicy(Qt::StrongFocus); //... show(); } void MyDialog::show() { QWindow *window = new QWindow(this); window->setGeometry(10, 10, 640, 480); // Create a custom widget that we will use as a mask on the window. QWidget *maskWidget = new QWidget(window); QPushButton *button = new QPushButton(window); button->setGeometry(5, 5, 150, 50); maskWidget->setStyleSheet("QWidget{background:transparent;border:0;}"); maskWidget

Field of the Invention The present invention relates to a method of producing a composite material comprising a ceramic material and a polymer material, and more particularly to a method of producing a composite material, which is suitable for production of a functional composite material. The present invention also relates to a method of producing a composite material, which is suitable for production of a functional composite material using a composite material comprising a polymer and ceramic particles and homogeneously dispersing and integrating ceramic particles, as well as to a composite material and a functional composite material obtained by the method. 2. Description of the Related Art In recent years, attention is paid to nano-materials, including nanoparticles or nanofibers. The nano-materials are expected to be applied to various uses because of their physical and chemical properties. As an example, ceramics or metal having excellent biocompatibility can be used for production of a functional composite material, which can be used in a biological field. A composite material obtained by using ceramics or metal with a particle size of nanometer order can provide a useful effect different from that of a conventional composite material, and thus the above has been expected to be utilized as a novel material. As an example of a conventional composite material including a polymer and a ceramic material having a particle size of nanometer order, a composite material prepared by using SiC and polycarbonate and an organic-inorganic composite material prepared by using SiC and polycarbonate having a particle size of nanometer order are known (Japanese Patent Application Laid-Open No. H11-221637 and Japanese Patent Application Laid-Open No. 2001-153179). However, composite materials containing cer
